"Primary Tumors of the Liver in Children."

Budapest, Magyar Sebeszet, Vol XVI, No 4, Aug 1963, pages 231-240.

Abstract: [Author's German summary] The author presents a short summary of the literature on primary tumors in the liver of children and, in addition to 129 cases of liver carcinoma found in the literature, reports three cases of tumor of the liver observed by himself. Two of these have been diagnosed as carcinoma hepatocellularis, the third case was found to be a benign hepatoma. The patient with the benign tumor is free of symptoms and complaints 3 1/2 years after the operation. The author calls attention to the surgical technique where the large segment and lobe of the liver is resected after the tying off of the large vessels and bile ducts. In suitable cases, this very serious operation is recommended by the author as the only means of prolonging the life of the patient to an appreciable degree. 54 Western, 8 Hungarian references.

70% of bilaterally vagotomized cats survive this operation for 1 to 6 days. Some of the cats develop typical lobar pneumonia. In this group Ca content of the lungs does not change, water, Na and Cl content increase. In the latter group there is no change. Blood serum NaCl drops in the pneumonia group only, Ca concn. increases in both groups. All changes in water and inorg. salt content of the lungs are due to infiltration and oedema. (German) A. B. L. "Bilateral Breast Cancer in the Patient Material of Our Clinic.
Some Aspects of Metastasis"

Budapest, Magyar Onkologia, Vol 10, No 4, Dec 1966, p 200.

Abstract: A statistical survey is offered of the more than 500 patients treated at authors' clinic for breast cancer. 35 of these patients had bilateral breast cancer, generally in an advanced stage. Authors conclude that in the majority of cases of bilateral breast cancer one of the tumors is a metastasis, and only in about 10% of the cases are both tumors primary.

"Simultaneous Occurrence of Refractory Anemia and Chromophobe Adenoma."

Budapest, Orvosi Hetilap, Vol 107, No 41, 9 Oct 66, pages 1943-1946.

Abstract: [Authors' Hungarian summary] The case of a 57 year old male patient
is described who had refractory anemia in the presence of hyperplastic,
"megaloblastoid" bone marrow. In the course of one year of observation, the
patient received 31 liters of blood. Drug therapy was without effect. At
autopsy, a chromophobe pituitary adenoma was found. The possibility of a
relationship between the two diseases is raised. 1 Hungarian, 14 Western

TITLE : Hostalen, Supralen and Asplit P and Their Use

ORIG. PUB. : Przem. chem., 1958, 37, No 11, 730-734

ABSTRACT : Description of the properties and uses of polyethylene (Hostalen, Supralen) and of molding composition based on phenol-formaldehyde resins (Asplit P) in manufacture of pipes for transfer of liquids and gases used in industry and of combustible nature, in the production of fittings, ventilation units, measuring and storage vessels and other chemical equipment. -- L. Sedov

MICROSCOPICAL THEORIES OF CHEMICAL ADSORPTION OF THE LANGMUIR-TYPE IN MULTICOMPONENT SYSTEMS

Figure 1. The effect of the number of training samples on the performance of the proposed model.

APPROVED FOR RELEASE: 07/13/2001

CIA-RDP86-00513R001654410020-8"

Some structural properties of aromatic azides, studied on the basis of their vibrational and electronic-vibrational spectra. Gy. Varsányi (Tech. Univ., Budapest, Hung.), S. Holly, and J. Szathmáry. *Periodica Polytech.* 2, 211-21 (1958) (in German). Infrared spectra in the range 2.8-15 μ were presented for phenyl azide (I), benzyl azide (II), and 2,4,6-tribromobenzyl azide (III) as liquids, and ultraviolet vapor spectra in the range 2470-2800 Å. were presented for I and II. Assignments were made for most of the absorption bands. In general, infrared frequencies for the three azides were similar with some lower values for II and III because of their larger mass. Bands for the azide group appeared for I, II, and III, resp., at 2115, 2115, 2108 for the asym. valence vibration, 1294, 1258, 1250 for the sym. valence vibration (Lieber, et al., CA 51, 12658g), 897, 875, 857 for the RN₂-N deformation vibration, and 670, 677, 682 cm.⁻¹, a possible azide vibration. The higher wave nos. for I indicated a higher electron d. between the two outer N atoms, a result of conjugation of the azide group with the ring. The ultraviolet spectrum of I consisted of a system of sharp bands due to the π electrons of the ring, with the O-O transition band at 36,359 cm.⁻¹, and a diffuse band system, due to the azide group, with its O-O band at 35,340 cm.⁻¹. Therefore conjugation was weak. In II the band systems were further apart, the bands of the azide group were sharper than the ring bands, the O-O transition of the ring appeared at 38,090 cm.⁻¹, and that of the azide group occurs at 35,199 cm.⁻¹. It was concluded that hyperconjugation was absent. The -I effect of the azide group was less than that of Cl since the O-O band of benzyl chloride appeared at 37,110 cm.⁻¹ (Hammer and Matsen, CA 42, 8849b).
